## Basic theorems of ground-state density functional theory

compare ground-state densities $\rho(\mathrm{r})$ resulting from different external potentials $\mathrm{v}(\mathrm{r})$.

QUESTION: Are the ground-state densities coming from different potentials always different?

## Hohenberg-Kohn-Theorem (1964)

$\mathrm{G}: \mathrm{v}(\mathrm{r}) \rightarrow \rho(\mathrm{r})$ is invertible

## Proof

Step 1: Invertibility of map A
Solve many-body Schrödinger equation for the external potential:

$$
\begin{aligned}
& \hat{\mathrm{V}}=\frac{\left(\mathrm{E}-\hat{\mathrm{T}}-\hat{\mathrm{W}}_{\mathrm{ee}}\right) \Psi}{\Psi} \\
& \sum_{\mathrm{j}=1}^{\mathrm{N}} \mathrm{v}\left(\mathrm{r}_{\mathrm{j}}\right)=-\frac{\hat{\mathrm{T}} \Psi}{\Psi}-\mathrm{W}_{\mathrm{ee}}\left(\overrightarrow{\mathrm{r}}_{1} \ldots \overrightarrow{\mathrm{r}}_{\mathrm{N}}\right)+\mathrm{constant}
\end{aligned}
$$

This is manifestly the inverse map: A given $\Psi$ uniquely yields the external potential.

Step 2: Invertibility of map Ã (HK proof by reductio ad absurdum)

## Consequence

Every quantum mechanical observable is completely determined by the ground state density.

$$
\text { Proof: } \quad \rho \xrightarrow{\mathrm{G}^{-1}} \mathrm{v}[\rho] \xrightarrow{\text { solve MBSE }} \Phi_{\mathrm{i}}[\rho]
$$

$$
\text { Observables } \quad \hat{\mathrm{B}}: \mathrm{B}_{\mathrm{i}}[\rho]=\left\langle\Phi_{\mathrm{i}}[\rho]\right| \hat{\mathrm{B}}\left|\Phi_{\mathrm{i}}[\rho]\right\rangle
$$

e.g. excitation spectrum: $\mathrm{E}_{\mathrm{i}}[\rho]$

## What is a FUNCTIONAL?

Generalization:
$\mathrm{v}_{\mathrm{r}}[\rho]=\mathrm{v}[\rho](\overrightarrow{\mathrm{r}}) \quad$ functional depending parametrically on $\overrightarrow{\mathrm{r}}$

$$
\psi_{\overrightarrow{\mathrm{r}}_{\ldots} \ldots \overrightarrow{\mathrm{r}}_{\mathrm{N}}}[\rho]=\psi[\rho]\left(\overrightarrow{\mathrm{r}}_{1} \ldots \overrightarrow{\mathrm{r}}_{\mathrm{N}}\right) \text { or on }\left(\overrightarrow{\mathrm{r}}_{1} \ldots \overrightarrow{\mathrm{r}}_{\mathrm{N}}\right)
$$

## Explicit construction of the HK map $\mathrm{v}_{\mathrm{s}}[\rho]$

(van Leeuwen \& Baerends, or Zhao \& Parr)

$$
\begin{aligned}
& \left(-\frac{h^{2} \nabla^{2}}{2 m}+v_{\mathrm{s}}(\mathrm{r})\right) \varphi_{\mathrm{i}}=\epsilon_{\mathrm{i}} \varphi_{\mathrm{i}} \\
& \sum_{\mathrm{i}} \varphi_{\mathrm{i}}^{*} \\
& \sum_{\mathrm{i}=1}^{\mathrm{N}} \varphi_{\mathrm{i}}^{*}\left(-\frac{\mathrm{h}^{2} \nabla^{2}}{2 \mathrm{~m}}\right) \varphi_{\mathrm{i}}+\mathrm{V}_{\mathrm{s}}(\mathrm{r}) \rho(\mathrm{r})=\sum_{\mathrm{i}=1}^{\mathrm{N}} \epsilon_{\mathrm{i}}\left|\varphi_{\mathrm{i}}(\mathrm{r})\right|^{2} \\
& \Rightarrow \mathrm{~V}_{\mathrm{s}}(\mathrm{r})=\frac{1}{\rho(\mathrm{r})} \cdot \sum_{\mathrm{i}=1}^{\mathrm{N}}\left(\epsilon_{\mathrm{i}}\left|\varphi_{\mathrm{i}}(\mathrm{r})\right|^{2}-\varphi_{\mathrm{i}}^{*}\left(-\frac{\mathrm{h}^{2} \nabla^{2}}{2 \mathrm{~m}}\right) \varphi_{\mathrm{i}}\right)
\end{aligned}
$$

## Iterative procedure

## $\rho_{0}(\mathrm{r})$ given (e.g. from experiment)

Start with an initial guess for $\mathrm{v}_{\mathrm{s}}(\mathrm{r}) \quad$ (e.g. GGA potential)

$$
\begin{aligned}
\text { solve } & \left(-\frac{\hbar^{2} \nabla^{2}}{2 \mathrm{~m}}+\mathrm{v}_{\mathrm{s}}(\mathrm{r})\right) \quad \varphi_{\mathrm{i}}=\epsilon_{\mathrm{i}} \varphi_{\mathrm{i}} \\
& \mathrm{v}_{\mathrm{s}}^{\mathrm{new}}(\mathrm{r})=\frac{1}{\rho_{0}(\mathrm{r})} \cdot \sum_{\mathrm{i}=1}^{\mathrm{N}}\left(\epsilon_{\mathrm{i}}\left|\varphi_{\mathrm{i}}(\mathrm{r})\right|^{2-} \varphi_{\mathrm{i}} *\left(-\frac{\mathfrak{h}^{2} \nabla^{2}}{2 \mathrm{~m}}\right) \varphi_{\mathrm{i}}\right)
\end{aligned}
$$

solve SE with $\mathrm{v}_{\mathrm{s}}{ }^{\text {new }}$ and iterate, keeping $\rho_{0}(\mathrm{r})$ fixed

## QUESTION:

How to calculate ground state density $\rho_{\mathrm{o}}(\overrightarrow{\mathrm{r}})$ of a given system (characterized by external potential $\mathrm{V}_{\mathrm{o}}=\sum v_{\mathrm{o}}(\overrightarrow{\mathrm{r}})$ ) without recourse to the Schrödinger Equation?

## Theorem:

There exists a density functional $\mathrm{E}_{\mathrm{HK}}[\rho]$ with properties

$$
\begin{aligned}
\text { i) } & \mathrm{E}_{\mathrm{HK}}[\rho]>\mathrm{E}_{\mathrm{o}} \text { for } \rho \neq \rho_{\mathrm{o}} \\
\text { ii) } & \mathrm{E}_{\mathrm{HK}}\left[\rho_{\mathrm{o}}\right]=\mathrm{E}_{\mathrm{o}}
\end{aligned}
$$

where $E_{o}=$ exact ground state energy of the system
Thus, Euler equation $\frac{\delta}{\delta \rho(\overrightarrow{\mathrm{r}})} \mathrm{E}_{\mathrm{HK}}[\rho]=0$
yields exact ground state density $\rho_{0}$.

## proof:

## formal construction of $\mathbf{E}_{\mathbf{H K}}[\rho]$ :

for arbitrary ground state density $\rho(\overrightarrow{\mathrm{r}}) \xrightarrow{\widetilde{\mathrm{A}}^{-1}} \Psi[\rho]$
define:

$$
\begin{aligned}
\mathrm{E}_{\mathrm{HK}}[\rho] & \left.\equiv\langle\Psi[\rho]| \hat{\mathrm{T}}+\hat{\mathrm{W}}+\hat{\mathrm{V}}_{\mathrm{o}}|\Psi[\rho]\rangle\right] \\
& >\mathbf{E}_{\mathbf{o}} \text { for } \rho \neq \rho_{\mathrm{o}} \\
& =\mathbf{E}_{\mathbf{0}} \text { for } \rho=\rho_{\mathrm{o}}
\end{aligned}
$$

$$
\mathbf{E}_{\mathbf{H K}}[\rho]=\int \mathbf{d}^{3} \mathbf{r} \rho(\mathbf{r}) \boldsymbol{v}_{\mathbf{0}}(\mathbf{r})+\underbrace{\langle\Psi[\rho]| \hat{\mathrm{T}}+\hat{\mathrm{W}}|\Psi[\rho]\rangle}_{\mathbf{F}[\rho] \text { is } \text { universal }}
$$

## HOHENBERG-KOHN THEOREM

1. $\mathrm{v}(\mathrm{r}) \stackrel{1-1}{\longleftrightarrow} \rho(\mathrm{r})$
one-to-one correspondence between external potentials $\mathrm{v}(\mathrm{r})$ and ground-state densities $\rho(\mathrm{r})$
2. Variational principle

Given a particular system characterized by the external potential $\mathbf{v}_{\mathbf{0}}(\mathbf{r})$. Then the solution of the Euler-Lagrange equation

$$
\frac{\delta}{\delta \rho(\mathrm{r})} \mathrm{E}_{\mathrm{HK}}[\rho]=0
$$

yields the exact ground-state energy $\mathrm{E}_{0}$ and ground-state density $\rho_{0}(\mathbf{r})$ of this system
3. $\mathrm{E}_{\mathrm{HK}}[\rho]=\mathrm{F}[\rho]+\int \rho(\mathrm{r}) \mathrm{v}_{0}(\mathrm{r}) \mathrm{d}^{3} \mathrm{r}$
$\mathrm{F}[\rho]$ is UNIVERSAL. In practice, $\mathrm{F}[\rho]$ needs to be approximated

## Expansion of $F[\rho]$ in powers of $\mathbf{e}^{\mathbf{2}}$

$F[\rho]=F^{(0)}[\rho]+e^{2} F^{(1)}[\rho]+e^{4} F^{(2)}[\rho]+\cdots$
where: $\mathrm{F}^{(0)}[\rho]=\mathrm{T}_{\mathrm{s}}[\rho] \quad$ (kinetic energy of non-interacting particles)

$$
\begin{aligned}
& \mathrm{e}^{2} \mathrm{~F}^{(1)}[\rho]=\frac{\mathrm{e}^{2}}{2} \iint \frac{\rho(\mathrm{r}) \rho\left(\mathrm{r}^{\prime}\right)}{\left|\mathrm{r}-\mathrm{r}^{\prime}\right|} \mathrm{dr}^{3} \mathrm{~d}^{3} \mathrm{r}^{\prime}+\mathrm{E}_{\mathrm{x}}[\rho] \quad \text { (Hartree }+ \text { exchange energies) } \\
& \sum_{\mathrm{i}=2}^{\infty}\left(\mathrm{e}^{2}\right)^{\mathrm{i}} \mathrm{~F}^{(\mathrm{i})}[\rho]=\mathrm{E}_{\mathrm{c}}[\rho] \quad \text { (correlation energy) } \\
& \Rightarrow \quad \mathbf{F}[\rho]=\mathbf{T}_{\mathrm{s}}[\rho]+\frac{\mathbf{e}^{2}}{2} \iint \frac{\rho(\mathbf{r}) \rho\left(\mathbf{r}^{\prime}\right)}{\mathbf{r}-\mathbf{r}^{\prime} \mid} \mathbf{d}^{3} \mathbf{r} \mathbf{d}^{3} \mathbf{r}^{\prime}+\mathbf{E}_{\mathbf{x}}[\rho]+\mathbf{E}_{\mathrm{c}}[\rho]
\end{aligned}
$$

## DF correlation energy versus traditional QC correlation energy

$$
\mathrm{E}_{\mathrm{c}}^{\mathrm{QC}}:=\mathbf{E}_{\text {tot }}-\mathbf{E}_{\text {tot }}^{\mathrm{HF}}\left[\varphi_{\mathrm{j}}^{\mathrm{HF}}\right]
$$

$$
\mathbf{E}_{\mathbf{c}}^{\mathrm{DFT}}:=\mathbf{E}_{\mathrm{tot}}-\mathbf{E}_{\mathrm{tot}}^{\mathrm{HF}}\left[\varphi_{\mathrm{j}}^{\mathrm{KS}}\right]
$$

$$
\mathrm{E}_{\mathrm{tot}}^{\mathrm{HF}}\left[\varphi_{\mathrm{j}}^{\mathrm{HF}}\right] \leq \mathrm{E}_{\mathrm{tot}}^{\mathrm{HF}}\left[\varphi_{\mathrm{j}}^{\mathrm{KS}}\right]
$$

$$
\Rightarrow \mathbf{E}_{\mathbf{c}}^{\mathrm{DFT}} \leq \mathbf{E}_{\mathbf{c}}^{\mathbf{Q C}}
$$

|  | $\mathbf{E}_{\mathrm{c}}{ }^{\text {DFT }}$ | $\mathbf{E}_{\mathrm{c}}{ }^{\text {QC }}$ |
| :--- | :--- | :---: |
| $\mathrm{H}^{-}$ | $-\mathbf{- 0 . 0 4 1 9 5}$ | $-\mathbf{0 . 0 3 9 8 2 1}$ |
| He | -0.042107 | $-\mathbf{- 0 . 0 4 2 0 4 4}$ |
| $\mathrm{Be}^{2+}$ | -0.044274 | -0.044267 |

details see: E.K.U.G., M.Petersilka, T.Grabo, in: Chemical Applications of Density Functional Theory, B.B. Laird, R.B. Ross, T. Ziegler, eds., ACS Symposium Series 629, 42 (1996).

## Kohn-Sham Theorem

Let $\rho_{0}(r)$ be the ground-state density of interacting electrons moving in the external potential $v_{0}(r)$. Then there exists a local potential $\mathbf{v}_{\mathrm{s}, \mathbf{0}}(\mathbf{r})$ such that non-interacting particles exposed to $v_{s, 0}(r)$ have the ground-state density $\rho_{0}(r)$, i.e.

$$
\begin{aligned}
& \left(-\frac{\nabla^{2}}{2}+\mathbf{v}_{\mathbf{s}, \mathbf{o}}(\mathbf{r})\right) \varphi_{\mathbf{j}}(\mathbf{r})=\epsilon_{\mathbf{j}} \varphi_{\mathbf{j}}(\mathbf{r}), \quad \boldsymbol{\rho}_{\mathbf{0}}(\mathbf{r})=\sum_{\substack{\mathbf{j}\left(\mathbf{w i t h} \\
\text { lowest } \epsilon_{\mathbf{j}}\right)}}^{\mathbf{N}}\left|\varphi_{\mathbf{j}}(\mathbf{r})\right|^{\mathbf{2}} \\
& \text { proof: } \quad \mathbf{V}_{\mathbf{s}, \mathbf{0}}(\mathbf{r})=\mathbf{V}_{\mathbf{s}}\left[\boldsymbol{\rho}_{\mathbf{0}}\right](\mathbf{r})
\end{aligned}
$$

Uniqueness follows from HK 1-1 mapping
Existence follows from V-representability theorem

By construction, the HK mapping is well-defined for all those functions $\rho(r)$ that are ground-state densities of some potential (so called V-representable functions $\rho(\mathrm{r})$ ).

QUESTION: Are all "reasonable" functions $\rho(\mathrm{r})$ V-representable?

## V-representability theorem (Chayes, Chayes, Ruskai, J Stat. Phys. 38 , 497 (1985))

On a lattice (finite or infinite), any normalizable positive function $\rho(r)$, that is compatible with the Pauli principle, is (both interacting and noninteracting) ensemble-V-representable.

In other words: For any given $\rho(r)$ (normalizable, positive, compatible with Pauli principle) there exists a potential, $v_{\text {ext }}[\rho](r)$, yielding $\rho(r)$ as interacting ground-state density, and there exists another potential, $\mathrm{v}_{\mathrm{s}}[\rho](\mathrm{r})$, yielding $\rho(r)$ as non-interacting ground-state density.

In the worst case, the potential has degenerate ground states such that the given $\rho(r)$ is representable as a linear combination of the degenerate ground-state densities (ensemble-V-representable).

Define $\mathbf{v}_{\mathrm{xc}}[\boldsymbol{\rho}](\mathbf{r})$ by the equation

$$
\mathbf{v}_{\mathrm{s}}[\boldsymbol{\rho}](\mathbf{r})=: \mathbf{v}_{\text {ext }}[\boldsymbol{\rho}](\mathbf{r})+\underbrace{\int \frac{\rho\left(\mathrm{r}^{\prime}\right)}{\left|\mathrm{r}-\mathrm{r}^{\prime}\right|} d^{3} \mathrm{r}^{\prime}}_{\mathbf{v}_{\mathbf{H}}[\boldsymbol{\rho}](\mathbf{r})}+\mathbf{v}_{\mathrm{xc}}[\boldsymbol{\rho}](\mathbf{r})
$$

## KS equations

$$
\begin{aligned}
& (-\frac{\nabla^{2}}{2}+\underbrace{\mathbf{v}_{\text {ext }}\left[\boldsymbol{\rho}_{0}\right](\mathbf{r})}_{\begin{array}{c}
\mathbf{v}_{0}(\mathbf{r}) \\
\text { fixed }
\end{array}}+\mathbf{v}_{\mathbf{H}}\left[\boldsymbol{\rho}_{\mathbf{0}}\right](\mathbf{r})+\mathbf{v}_{\mathrm{xc}}\left[\boldsymbol{\rho}_{\mathrm{o}}\right](\mathbf{r})) \varphi_{\mathrm{j}}(\mathbf{r})=\epsilon_{\mathrm{j}} \varphi_{\mathrm{j}}(\mathbf{r}) \\
& \text { to be solved selfconsistently with } \quad \boldsymbol{\rho}_{\mathbf{o}}(\mathbf{r})=\sum\left|\varphi_{\mathrm{j}}(\mathbf{r})\right|^{2}
\end{aligned}
$$

Note: The KS equations do not follow from the variational principle. They follow from the HK 1-1 mapping and the V-representability theorem.

Variational principle gives an additional property of $\mathbf{v}_{\mathbf{x}}$ :

$$
\mathbf{v}_{\mathrm{xc}}\left[\rho_{\mathrm{o}}\right](\mathbf{r})=\left.\frac{\delta \mathbf{E}_{\mathrm{xc}}[\rho]}{\delta \rho(\mathbf{r})}\right|_{\rho_{0}}
$$

where $E_{x c}[\rho]:=F[\rho]-\frac{1}{2} \int \frac{\rho(r) \rho\left(r^{\prime}\right)}{\left|r-r^{\prime}\right|} d^{3} r d^{3} r^{\prime}-T_{s}[\rho]$

## Consequence:

Approximations can be constructed either for $\mathbf{E}_{\mathbf{x c}}[\rho]$ or directly for $\mathbf{v}_{\mathrm{xc}}[\rho](\mathrm{r})$.

## TOWARDS THE EXACT FUNCTIONAL

$$
F[\rho]=T_{s}[\rho]+\frac{1}{2} \int d^{3} r \int d^{3} r^{\prime} \frac{\rho(r) \rho\left(r^{\prime}\right)}{\left|r-r^{\prime}\right|}+E_{x}[\rho]+E_{c}[\rho]
$$

$1^{\text {st }}$ generation of DFT: Use approximate functionals (LDA/GGA) for $\mathrm{T}_{\mathrm{s}}, \mathrm{E}_{\mathrm{x}}$ and $E_{c}$ e.g.

$$
\mathrm{T}_{s}[\rho]=\int \mathrm{d}^{3} \mathrm{r}\left(\mathrm{a} \rho(\mathrm{r})^{5 / 3}+\mathrm{b} \frac{(\nabla \rho)^{2}}{\rho}+\cdots\right)
$$

$\Rightarrow$ Thomas-Fermi-type equation has to be solved
$\underline{2^{\text {nd }}}$ generation of DFT: Use exact functional $\mathrm{T}_{\mathrm{s}}$ exact $[\rho]$ and LDA/GGA for $\mathrm{E}_{\mathrm{x}}$ and $E_{c}$
$\Rightarrow \mathrm{KS}$ equations have to be solved

$$
\mathrm{T}_{\mathrm{s}}^{\mathrm{exacac}}[\rho]=\sum_{\mathrm{j}_{\mathrm{occ}}} \int \mathrm{~d}^{3} \mathrm{r} \varphi_{\mathrm{j}}^{*}[\rho](\mathrm{r})\left(-\frac{\nabla^{2}}{2}\right) \varphi_{\mathrm{j}}[\rho](\mathrm{r})
$$

$33^{\text {rd }}$ generation of DFT: Use $T_{s}{ }^{\text {exact }}[\rho]$, and an orbital functional $\mathrm{E}_{\mathrm{xc}}\left[\varphi_{1}, \varphi_{2}, \ldots\right]$

$$
\begin{aligned}
& \text { e.g. } E_{\mathrm{x}}^{\text {exact }}[\rho]=-\sum_{\sigma=\uparrow \downarrow} \sum_{\mathrm{j}, \mathrm{k}}^{N \sigma} \int \frac{\varphi_{\mathrm{kc}}^{*}[\rho]\left(\mathrm{r}^{\prime}\right) \varphi_{\mathrm{k} \mathrm{\sigma}}(\mathrm{r}) \varphi_{\mathrm{j}}^{*}(\mathrm{r}) \varphi_{\mathrm{jo}}\left(\mathrm{r}^{\prime}\right)}{\left|\mathrm{r}-\mathrm{r}^{\prime}\right|} d^{3} \mathrm{r} d^{3} r^{\prime}
\end{aligned}
$$

$\Rightarrow$ KS equations have to be solved self-consistently with OPM integral equation

## Limitations of 2 ${ }^{\text {nd }}$ generation (LDA/GGA for $\mathbf{E}_{\mathbf{x c}}$ )

- Not free from spurious self-interactions KS potential decays more rapidly than $\mathrm{r}^{-1}$
Consequences: - no Rydberg series
- negative atomic ions not bound
- ionization potentials (if calculated from highest occupied orbital energy) too small
- Dispersion forces cannot be described
$\mathrm{W}_{\text {int }}(\mathrm{R}) \longrightarrow \mathrm{e}^{-\mathrm{R}}$ (rather than $\mathrm{R}^{-6}$ )
- band gaps too small:

$$
\mathrm{E}_{\text {gap }}{ }^{\mathrm{LDA} A} \approx 0.5 \mathrm{E}_{\text {gap }}{ }^{\text {exp }}
$$

- Cohesive energies of bulk metals not satisfactory
in LDA overestimated in GGA underestimated
- Wrong ground state for strongly correlated solids, e.g. $\mathrm{FeO}, \mathrm{La}_{2} \mathrm{CuO}_{4}$ predicted as metals

# Orbital Functionals in DFT: Historical Overview 

OEP idea (within EXX): Sharp, Horton, Phys. Rev. 90, 317 (1953)

First OEP calculation: Talman, Shadwick, Phys. Rev. A 14, 36 (1976)
KS potential $\equiv$ OEP: J. Perdew (1983 NATO ASI in Alcabideche)

Derivation given here:
V. Shaginyan, PRA 47, 1507 (1993)
A. Görling, M. Levy, PRA 50, 196 (1994)
R. Van Leeuwen (PhD thesis 1994)

First OEP calculation with orbital functional for correlation energy:
T. Grabo, E.K.U.G., Chem. Phys. Lett. 240, 141 (1995)

Approximate semi-analytical ("KLI") solution of OEP equations:
Krieger, Li, Iafrate, Phys. Lett. A 148, 470 (1990)

Apply HK theorem to non-interacting particles

$$
\rho \text { given } \Rightarrow \mathrm{v}_{\mathrm{s}}=\mathrm{v}_{\mathrm{s}}[\rho] \Rightarrow\left(-\frac{\nabla^{2}}{2}+\mathrm{v}_{\mathrm{s}}[\rho](\mathrm{r})\right) \varphi_{\mathrm{i}}(\mathrm{r})=\epsilon_{\mathrm{i}} \varphi_{\mathrm{i}}(\mathrm{r}) \quad \begin{aligned}
& \varphi_{\mathrm{i}}=\varphi_{\mathrm{i}}[\rho] \\
& \epsilon_{\mathrm{i}}=\in_{[ }[\rho]
\end{aligned}
$$

consequence:
Any orbital functional, $\mathrm{E}_{\mathrm{xc}}\left[\varphi_{1}, \varphi_{2} \ldots\right]$, is an (implicit) density functional provided that the orbitals come from a local (i.e., multiplicative) potential.
"optimized effective potential" $\equiv$ KS xc potential

$$
\begin{aligned}
& \mathrm{v}_{\mathrm{xc}}^{\mathrm{OEP}}(\mathrm{r})=\frac{\delta}{\delta \rho(\mathrm{r})} \mathrm{E}_{\mathrm{xc}}\left[\varphi_{1} \ldots \varphi_{\mathrm{N}}\right] \\
& \mathrm{v}_{\mathrm{xc}}^{\mathrm{OEP}}(\mathrm{r})=\sum_{\mathrm{j}} \int \mathrm{~d}^{3} \mathrm{r}^{\prime} \int \mathrm{d}^{3} \mathrm{r}^{\prime \prime} \frac{\delta \mathrm{E}_{\mathrm{xc}}}{\delta \varphi_{\mathrm{j}}\left(\mathrm{r}^{\prime}\right)} \frac{\delta \varphi_{\mathrm{j}}\left(\mathrm{r}^{\prime}\right)}{\delta \mathrm{v}_{\mathrm{s}}\left(\mathrm{r}^{\prime \prime}\right)} \frac{\delta \mathrm{v}_{\mathrm{s}}\left(\mathrm{r}^{\prime \prime}\right)}{\delta \rho(\mathrm{r})} \underbrace{}_{\chi_{\mathrm{Ks}}{ }^{-1}\left(\mathrm{r}^{\prime \prime}, \mathrm{r}\right)}+\mathrm{c} . \mathrm{c} .
\end{aligned}
$$

act with $\chi_{\mathrm{KS}}$ on equation:

$$
\Rightarrow \begin{array}{|l|l|}
\hline \int \chi_{\mathrm{KS}}\left(\mathrm{r}, \mathrm{r}^{\prime}\right) \mathrm{v}_{\mathrm{xc}}^{\mathrm{OPM}}\left(\mathrm{r}^{\prime}\right) \mathrm{d}^{3} \mathrm{r}^{\prime}=\sum_{\mathrm{j}} \int \mathrm{~d}^{3} \mathrm{r}^{\prime} \underbrace{\frac{\delta \mathrm{E}_{\mathrm{xc}}}{\delta \varphi_{\mathrm{j}}\left(\mathrm{r}^{\prime}\right)} \frac{\delta \varphi_{\mathrm{j}}\left(\mathrm{r}^{\prime}\right)}{\delta \mathrm{v}_{\mathrm{s}}(\mathrm{r})}}+\text { c.c. } \\
\hline \text { OPM integral equation } & \underbrace{}_{\text {known functional of }\left\{\varphi_{\mathrm{j}}\right\}}
\end{array}
$$

## OEP integral equation

$$
\sum_{i=1}^{N_{\sigma}} \int d^{3} \mathbf{r}^{\prime}\left(\mathbf{V}_{\mathrm{xc}, \sigma}\left(\mathbf{r}^{\prime}\right)-\mathbf{u}_{\mathrm{xc}, \mathrm{i} \mathrm{\sigma}}\left(\mathbf{r}^{\prime}\right)\right) K_{\mathrm{io}}\left(\mathbf{r}, \mathbf{r}^{\prime}\right) \varphi_{\mathrm{i} \mathrm{\sigma}}(\mathbf{r}) \varphi_{\mathrm{io}} *\left(\mathbf{r}^{\prime}\right)+\mathbf{c . c} .=\mathbf{0}
$$

where $\mathrm{K}_{\mathrm{i} \mathrm{\sigma}}\left(\mathrm{r}, \mathrm{r}^{\prime}\right)=\sum_{\substack{\mathrm{k}=1 \\ \mathrm{k} \neq 1}}^{\infty} \frac{\varphi_{\mathrm{k} \mathrm{\sigma}}{ }^{*}(\mathrm{r}) \varphi_{\mathrm{k} \mathrm{\sigma}}\left(\mathrm{r}^{\prime}\right)}{\epsilon_{\mathrm{k} \mathrm{\sigma}}-\epsilon_{\mathrm{i} \mathrm{\sigma}}}$
and

$$
\mathrm{u}_{\mathrm{xc}, \mathrm{i} \sigma}(\mathrm{r}):=\frac{1}{\varphi_{\mathrm{io}}{ }^{*}(\mathrm{r})} \cdot \frac{\delta \mathrm{E}_{\mathrm{x}}\left[\varphi_{\mathrm{ic}} \ldots\right]}{\delta \varphi_{\mathrm{io}}(\mathrm{r})}
$$

to be solved simultaneously with KS equation:

$$
\left(-\frac{\nabla^{2}}{2}+\mathrm{V}_{\mathrm{o}}(\mathrm{r})+\int \frac{\rho\left(\mathbf{r}^{\prime}\right)}{\left|\mathbf{r}-\mathbf{r}^{\prime}\right|}+\mathrm{V}_{\mathrm{xc}, \sigma}(\mathrm{r})\right) \varphi_{\mathrm{j} \sigma}(\mathrm{r})=\epsilon_{\mathrm{j} \sigma} \varphi_{\mathrm{j} \sigma}(\mathrm{r})
$$

## Orbital functionals available

- order-by-order KS-MBPT
- Resummation of infinitely many terms of the MBP-series (e.g. RPA)
- Functionals from TDDFT
- Self-Interaction-Corrected LDA or GGA (SIC)
- Meta-GGA
- Interaction-Strength-Interpolation (ISI)
- Hybrid functionals (e.g. B3LYP)
- Colle-Salvetti

## Systematic approach to construct $\mathbf{E}_{\mathrm{xc}}$ using KS-MBPT

$$
\mathrm{H}_{\mathrm{KS}} \longrightarrow \text { unperturbed system }
$$

$$
\mathbf{H}=\mathbf{H}_{\mathrm{KS}}+\lambda \mathbf{H}_{1},
$$

where $\quad H_{1}=W_{e e}-\int d^{3} r \rho(r)\left(v_{H}(r)+v_{x c}(r)\right)$

$$
\begin{aligned}
& \mathrm{E}_{\mathrm{x}}^{\text {exact }}[\rho]=\underbrace{\longrightarrow}_{\sigma=\uparrow \downarrow \mathrm{j}, \mathrm{k}} \\
& =-\frac{1}{2} \sum \sum \frac{\varphi_{\mathrm{k} \sigma}^{*}\left(\mathrm{r}^{\prime}\right) \varphi_{\mathrm{k} \mathrm{\sigma}}(\mathrm{r}) \varphi_{\mathrm{j} \mathrm{\sigma} \sigma}^{*}(\mathrm{r}) \varphi_{\mathrm{j} \sigma}\left(\mathrm{r}^{\prime}\right)}{\left|\mathrm{r}-\mathrm{r}^{\prime}\right|} \mathrm{d}^{3} \mathrm{rd}^{3} \mathrm{r}^{\prime}
\end{aligned}
$$

$\mathrm{E}_{\mathrm{c}}[\rho]=$ sum of all higher-order diagrams in terms of the Green's function

$$
\mathrm{G}_{\mathrm{s} \sigma}\left(\mathrm{r}, \mathrm{r}^{\prime}\right)=\sum_{\mathrm{k}} \frac{\varphi_{\mathrm{k} \sigma}(\mathrm{r}) \varphi_{\mathrm{k} \sigma}^{*}\left(\mathrm{r}^{\prime}\right)}{\omega-\varepsilon_{\mathrm{k} \sigma}} \Rightarrow \begin{aligned}
& \text { The exact } \mathrm{E}_{\mathrm{xc}}[\rho] \text { is an } \\
& \text { orbital functional }
\end{aligned}
$$

## Ionization energies for atoms and ions

Ionization energies (in a.u.) from highest occupied KS energy

Helium Isoelectronic Series

## True gap vs. KS gap; Discontinuity of $\mathbf{V}_{\mathbf{x}}$

$\mathrm{E}_{\text {gap }}=\varepsilon_{\text {gap }}^{\mathrm{KS}}+\Delta_{\mathrm{xc}} \quad \Delta_{\mathrm{xc}}=\Delta_{\mathrm{x}}+\Delta_{\mathrm{c}}=$ discontinuity of xc - potential
$E_{\text {gap }}=\varepsilon_{\text {gap }}^{E X X}+\varepsilon_{\text {gap }}^{\mathbf{c}}+\Delta_{\mathrm{X}}+\Delta_{\mathrm{c}}$
Gap problem: how large is $\Delta_{\mathrm{xc}}$ ?
Can prove
$\Delta_{\mathbf{x}}=\left\langle\varphi_{\mathrm{N}+1}(\mathbf{N})\right| \mathbf{V}_{\mathbf{x}}^{\mathrm{NL}}-\mathbf{V}_{\mathbf{x}}\left|\varphi_{\mathrm{N}+1}(\mathbf{N})\right\rangle-\left\langle\varphi_{\mathbf{N}}(\mathbf{N})\right| \mathbf{V}_{\mathbf{x}}^{\mathrm{NL}}-\mathbf{V}_{\mathbf{x}}\left|\varphi_{\mathrm{N}}(\mathbf{N})\right\rangle$

## Fundamental band gap in semiconductors and insulators

## Gap in Hartree-Fock:

$$
\begin{aligned}
\mathbf{E}_{\mathrm{g}}{ }^{\mathrm{HF}} & =\mathbf{E}^{\mathrm{HF}}(\mathbf{N}+\mathbf{1})-\mathbf{2} \mathbf{E}^{\mathrm{HF}}(\mathbf{N})+\mathbf{E}^{\mathrm{HF}}(\mathbf{N}-\mathbf{1}) \\
& =\epsilon_{\mathrm{N}+1}{ }^{\mathrm{HF}}(\mathbf{N})-\epsilon_{N^{H}}{ }^{\mathrm{HF}}(\mathbf{N})
\end{aligned}
$$

## DFT with exact exchange (OPM)

$$
\begin{aligned}
\mathbf{E}_{\mathrm{g}}^{\mathrm{OEP}} & =\operatorname{E}^{\mathrm{OEP}}(\mathbf{N}+1)-2 \mathbf{E}^{\mathrm{OEP}}(\mathbf{N})+\mathbf{E}^{\mathrm{OEP}}(\mathbf{N}-1) \\
& =\epsilon_{\mathrm{N}+1}{ }^{\mathrm{KS}}(\mathbf{N})-\epsilon_{\mathrm{N}}{ }^{\mathrm{KS}}(\mathbf{N})+\Delta_{\mathrm{x}}
\end{aligned}
$$

$$
\text { discontinuity of } v_{x}
$$

$$
\mathbf{E}^{\mathrm{HF}} \approx \mathbf{E}^{\mathrm{OPM}} \Rightarrow \mathbf{E}_{\mathrm{g}}{ }^{\mathrm{HF}} \approx \mathbf{E}_{\mathrm{g}}^{\mathrm{OPM}}
$$

## Cohesive Energies

## Orbital functionals for the static xc energy derived from TDDFT

First ingredient: Adiabatic Connection Formula

$$
\begin{aligned}
H(\lambda)= & T+\sum_{i=1}^{N} v_{\lambda}\left(r_{i}\right)+\lambda \frac{e^{2}}{2} \sum_{\substack{i, k=1 \\
i \neq k}}^{N} \frac{1}{\left|r_{i}-r_{k}\right|} \quad 0 \leq \lambda \leq 1 \\
H(\lambda=1)= & T+\sum_{i=1}^{N} v_{\text {nuc }}\left(r_{i}\right)+\frac{e^{2}}{2} \sum_{\substack{i, k=1 \\
i=k}}^{N} \frac{1}{\left|r_{i}-r_{k}\right|} \\
& =\text { Hamiltonian of fully interacting system }
\end{aligned}
$$

Choose $\mathrm{v}_{\lambda}(\mathrm{r})$ such that for each $\lambda$ the ground- state density satisfies $\rho_{\lambda}(r)=\rho_{\lambda=1}(r)$

Hence

$$
\begin{aligned}
& \mathrm{v}_{\lambda=0}(\mathrm{r})=\mathrm{v}_{\mathrm{KS}}(\mathrm{r}) \\
& \mathrm{v}_{\lambda=1}(\mathrm{r})=\mathrm{v}_{\text {nuc }}(\mathrm{r})
\end{aligned}
$$

Determine the response function $\chi^{(\lambda)}\left(\mathrm{r}, \mathrm{r}^{\prime} ; \omega\right)$ corresponding to $\mathrm{H}(\lambda)$, Then

$$
\mathrm{E}_{\mathrm{xc}}=-\int_{0}^{1} \mathrm{~d} \lambda \int_{0}^{\infty} \frac{\mathrm{du}}{2 \pi} \int \mathrm{~d}^{3} \mathrm{r} \int \mathrm{~d}^{3} \mathrm{r}^{\prime} \frac{\mathrm{e}^{2}}{\left|\mathrm{r}-\mathrm{r}^{\prime}\right|}\left\{\chi^{(\lambda)}\left(\mathrm{r}, \mathrm{r}^{\prime} ; \mathrm{iu}\right)+\rho(\mathrm{r}) \delta\left(\mathrm{r}-\mathrm{r}^{\prime}\right)\right\}
$$

Exact representation of $\mathrm{E}_{\mathrm{xc}}$

## Second ingredient : TDDFT

$$
\chi=\chi_{\mathrm{s}}+\chi_{\mathrm{s}}\left[\mathrm{~W}_{\mathrm{clb}}+\mathrm{f}_{\mathrm{xc}}\right] \chi
$$

and for $0 \leq \lambda \leq 1$ :

$$
\chi^{(\lambda)}=\chi_{\mathrm{s}}+\chi_{\mathrm{s}}\left(\lambda \mathrm{~W}_{\mathrm{Clb}}+\mathrm{f}_{\mathrm{xc}}^{(\lambda)}\right] \chi^{(\lambda)}
$$

$\mathbf{r}_{\mathrm{s}}$-dependent deviation of approximate correlation energies from the "exact" correlation energy per electron of the uniform electron gas. M. Lein, E. K. U. G., J. Perdew, Phys. Rev. B 61, 13431 (2000).

For finite systems, truncate after first iteration:
$\chi^{(\lambda)} \approx \chi_{\mathrm{s}}+\chi_{\mathrm{s}}\left[\lambda \mathbf{W}_{\mathrm{clb}}+\mathrm{f}_{\mathrm{xc}}{ }^{(\lambda)}\right] \chi_{\mathrm{s}}$
plug this approximation into adiabatic connection formula

## $\Rightarrow$ Orbital functional for $\mathbf{E}_{c}$

# DENSITY-FUNTIONAL THEORY OF MAGNETIC SYSTEMS 

Weak magnetic field: Zeeman coupling of B to the spin magnetization $m(r)$

Strong magnetic field: In addition coupling of vector potential to orbital currents $\mathbf{j}_{\mathbf{p}}(\mathbf{r})$

Include $\mathbf{m}(\mathbf{r})$ and $\mathrm{j}_{\mathrm{p}}(\mathbf{r})$ as basic variables in the formalism, in addition to the density $\rho(r)$.

## DFT for spin-polarized systems

$$
\hat{H}_{v, \vec{B}}=\hat{T}+\hat{W}+\int \hat{\rho}(r) v(r) d^{3} r-\int \hat{\vec{m}}(r) \cdot \vec{B}(r) d^{3} r
$$

$$
\overrightarrow{\mathrm{m}}=\text { spin magnetization }: \hat{\overrightarrow{\mathrm{m}}}(\mathrm{r})=-\mu_{o} \sum_{\alpha \beta} \hat{\psi}_{\alpha}^{+}(\mathrm{r}) \vec{\sigma}_{\alpha \beta} \hat{\psi}_{\beta}(\mathrm{r})
$$

## HK theorem

$$
[\rho(\mathrm{r}), \overrightarrow{\mathrm{m}}(\mathrm{r})] \stackrel{1-1}{\longleftrightarrow}[\psi]
$$

total energy:

$$
\mathrm{E}_{\mathrm{v}, \overrightarrow{\mathrm{~B}}}[\rho, \overrightarrow{\mathrm{~m}}]=\underset{\text { universal }}{\mathrm{F}[\rho, \overrightarrow{\mathrm{~m}}]+\int \mathrm{d}^{3} \mathrm{r}(\mathrm{v}(\mathrm{r}) \rho(\mathrm{r})-\overrightarrow{\mathrm{B}}(\mathrm{r}) \cdot \overrightarrow{\mathrm{m}}(\mathrm{r}))}
$$

## KS scheme

$$
\begin{aligned}
& \text { For simplicity: } \quad \overrightarrow{\mathrm{B}}(\boldsymbol{r})=\left(\begin{array}{c}
0 \\
0 \\
\mathrm{~B}(\boldsymbol{r})
\end{array}\right) \quad, \quad \overrightarrow{\mathrm{m}}(\boldsymbol{r})=\left(\begin{array}{c}
0 \\
0 \\
\mathrm{~m}(\boldsymbol{r})
\end{array}\right) \\
& \left(-\frac{\nabla^{2}}{2 \mathrm{~m}}+\left[\mathrm{v}(\mathbf{r})+\mathrm{v}_{\mathrm{H}}(\mathbf{r})+\mathbf{v}_{\mathrm{xc}}(\mathbf{r})\right] \pm \mu_{\mathrm{o}}\left[\mathrm{~B}(\mathbf{r})-\mathbf{B}_{\mathrm{xc}}(\mathbf{r})\right]\right) \varphi_{ \pm}^{j}(\mathbf{r})=\epsilon_{ \pm}^{j} \varphi_{ \pm}^{j}(\mathbf{r}) \\
& \mathbf{v}_{\mathrm{xc}}[\rho, \mathrm{~m}]=\delta \mathrm{E}_{\mathrm{xc}}[\rho, \mathrm{~m}] / \delta \rho \quad \mathbf{B}_{\mathrm{xc}}[\rho, \mathrm{~m}]=\delta \mathrm{E}_{\mathrm{xc}}[\rho, \mathrm{~m}] / \delta \mathrm{m} \\
& \rho(r)=\rho_{+}(r)+\rho_{-}(r), m(r)=\rho_{+}(r)-\rho_{-}(r), \rho_{ \pm}=\Sigma\left|\varphi_{j_{ \pm}}\right|^{2}
\end{aligned}
$$

These equations do not reduce to the original KS equations for $B \rightarrow 0$ if, in this limit, the system has a finite $m(r)$.

Traditional DFT: $\mathrm{E}_{\mathrm{xc}}[\rho]$

$$
\mathrm{v}_{\mathrm{xc}}(\mathrm{r})=\frac{\delta \mathrm{E}_{\mathrm{xc}}[\rho]}{\delta \rho(\mathrm{r})}
$$

\overrightarrow{\mathrm{A}}_{\mathrm{xc}}(\mathrm{r})=\mathrm{c} \frac{\delta \mathrm{E}_{\mathrm{xc}}\left[\rho, \mathrm{~m}, \overrightarrow{\mathrm{j}}_{\mathrm{p}}\right]}{\delta \overrightarrow{\mathrm{j}}_{\mathrm{p}}(\mathrm{r})}
$$

Non-Col. CSDFT: $\mathrm{E}_{\mathrm{xc}}\left[\rho, \overrightarrow{\mathrm{m}}_{\mathrm{j}} \overrightarrow{\mathrm{j}}_{\mathrm{p}}\right] \quad \mathrm{v}_{\mathrm{xc}}(\mathrm{r})=\frac{\delta \mathrm{E}_{\mathrm{xc}}\left[\rho, \overrightarrow{\mathrm{m}}, \overrightarrow{\mathrm{j}}_{\mathrm{p}}\right]}{\delta \rho(\mathrm{r})} \quad \overrightarrow{\mathrm{B}}_{\mathrm{xc}}(\mathrm{r})=-\frac{\delta \mathrm{E}_{\mathrm{xc}}\left[\rho, \overrightarrow{\mathrm{m}}, \overrightarrow{\mathrm{j}_{\mathrm{p}}}\right]}{\delta \overrightarrow{\mathrm{m}}(\mathrm{r})}$

$$
\overrightarrow{\mathrm{A}}_{\mathrm{xc}}(\mathrm{r})=\mathrm{c} \frac{\delta \mathrm{E}_{\mathrm{xc}}\left[\rho, \overrightarrow{\mathrm{~m}}, \overrightarrow{\mathrm{j}}_{\mathrm{p}}\right]}{\delta \overrightarrow{\mathrm{j}}_{\mathrm{p}}(\mathrm{r})}
$$

KS equation for the most general case (non-collinear CSDFT):

$$
\left[\frac{1}{2}\left(-\mathrm{i} \vec{\nabla}+\frac{1}{\mathrm{c}} \overrightarrow{\mathrm{~A}}_{\mathrm{s}}(\mathrm{r})\right)^{2}+\mathrm{v}_{\mathrm{s}}(\mathrm{r})+\mu_{\mathrm{B}} \vec{\sigma} \cdot \overrightarrow{\mathrm{~B}}_{\mathrm{s}}(\mathrm{r})\right] \Phi_{\mathrm{i}}(\mathrm{r})=\varepsilon_{\mathrm{i}} \Phi_{\mathrm{i}}(\mathrm{r})
$$

$$
\begin{aligned}
& \mathrm{V}_{\mathrm{s}}(\mathrm{r})=\mathrm{V}_{0}(\mathrm{r})+\mathrm{V}_{\mathrm{H}}(\mathrm{r})+\mathrm{v}_{\mathrm{xc}}(\mathrm{r})+\frac{1}{2 \mathrm{c}^{2}}\left[\mathrm{~A}_{0}^{2}(\mathrm{r})-\mathrm{A}_{\mathrm{s}}^{2}(\mathrm{r})\right] \\
& \overrightarrow{\mathrm{B}}_{\mathrm{s}}(\mathrm{r})=\overrightarrow{\mathrm{B}}_{0}(\mathrm{r})+\overrightarrow{\mathrm{B}}_{\mathrm{xc}}(\mathrm{r}) \quad \overrightarrow{\mathrm{A}}_{\mathrm{s}}(\mathrm{r})=\overrightarrow{\mathrm{A}}_{0}(\mathrm{r})+\overrightarrow{\mathrm{A}}_{\mathrm{xc}}(\mathrm{r}) \\
& \rho(\mathrm{r})=\sum_{\mathrm{i}=1}^{\mathrm{N}} \Phi_{\mathrm{i}}^{\dagger}(\mathrm{r}) \Phi_{\mathrm{i}}(\mathrm{r}) \quad \overrightarrow{\mathrm{m}}(\mathrm{r})=-\mu_{\mathrm{B}} \sum_{\mathrm{i}=1}^{\mathrm{N}} \Phi_{\mathrm{i}}^{\dagger}(\mathrm{r}) \vec{\sigma} \Phi_{\mathrm{i}}(\mathrm{r}) \\
& \overrightarrow{\mathrm{j}}_{\mathrm{p}}(\mathrm{r})=\frac{1}{2 \mathrm{i}} \sum_{\mathrm{i}=1}^{\mathrm{N}}\left[\Phi_{\mathrm{i}}^{\dagger}(\mathrm{r}) \vec{\nabla} \Phi_{\mathrm{i}}(\mathrm{r})-\left(\vec{\nabla} \Phi_{\mathrm{i}}^{\dagger}(\mathrm{r})\right) \Phi_{\mathrm{i}}(\mathrm{r})\right]
\end{aligned}
$$

## Functionals available:

## Ordinary LSDA yields GLOBAL collinearity

$$
\overrightarrow{\mathrm{B}}_{\mathrm{xc}}(\mathrm{r})=\left(\begin{array}{c}
0 \\
0 \\
\mathrm{~B}_{\mathrm{xc}}(\mathrm{r})
\end{array}\right) \quad \overrightarrow{\mathrm{m}}(\mathrm{r})=\left(\begin{array}{c}
0 \\
0 \\
\mathrm{~m}(\mathrm{r})
\end{array}\right)
$$

$\overrightarrow{\mathrm{B}}_{\mathrm{xc}}, \overrightarrow{\mathrm{m}}$ parallel to $\left(\begin{array}{l}0 \\ 0 \\ 1\end{array}\right)$ everywhere in space

$$
\begin{aligned}
& \int \rho(\mathrm{r}) \mathrm{v}(\mathrm{r}) \mathrm{d}^{3} \mathrm{r}-\int \overrightarrow{\mathrm{m}}(\mathrm{r}) \cdot \overrightarrow{\mathrm{B}}(\mathrm{r}) \mathrm{d}^{3} \mathrm{r} \\
& \quad \equiv \sum_{\alpha, \beta=\uparrow \downarrow} \int \rho_{\alpha, \beta}(\mathrm{r}) \mathrm{v}_{\alpha, \beta}(\mathrm{r})
\end{aligned}
$$

$\{\rho(\mathrm{r}), \overrightarrow{\mathrm{m}}(\mathrm{r})\}: 4$ independent functions

## $\rho_{\alpha \beta}$ is Hermitian $\Rightarrow 4$ independent functions

## Non-collinear LSDA:

(Kübler '80s)
$\overrightarrow{\mathrm{r}}$ given point in space:
(1) Find unitary matrix $U(r)$ such that

$$
\mathrm{U}^{+}(\mathrm{r})\left(\rho_{\alpha \beta}\right) \mathrm{U}(\mathrm{r})=\left(\begin{array}{cc}
\mathrm{n}_{\uparrow}(\mathrm{r}) & 0 \\
0 & \mathrm{n}_{\downarrow}(\mathrm{r})
\end{array}\right)
$$

(2) Calculate $\mathrm{v}_{\mathrm{xc}}^{\uparrow}(\mathrm{r})$ and $\mathrm{v}_{\mathrm{xc}}^{\downarrow}(\mathrm{r})$ from $\left\{\mathrm{n}_{\uparrow}, \mathrm{n}_{\downarrow}\right\}$ using the normal LSDA expressions
(3) $\left(v_{x c}^{\alpha \beta}\right)=U(r)\left(\begin{array}{cc}v_{x c}^{\uparrow}(r) & 0 \\ 0 & v_{x c}^{\downarrow}(r)\end{array}\right) U^{+}(r)$
in this approximation $\overrightarrow{\mathrm{B}}_{\mathrm{xc}}(\mathrm{r})$ and $\overrightarrow{\mathrm{m}}(\mathrm{r})$ may change their direction in space, but locally they are always parallel

## Extension of OEP to non-collinear spin DFT

Ordinary Spin-DFT: KS orbitals are spin eigenfunctions
Generalization to include relativistic effects on the level of spin-orbit coupling: KS orbitals are two-component (Pauli) spinors
xc magnetic field $\mathbf{B}_{\mathbf{x c}}(\mathrm{r})$ not globally and not locally collinear with $\mathbf{m}(\mathrm{r})$

OEP equations are easily formulated:

$$
\begin{aligned}
& \mathrm{v}_{\mathrm{xc}}^{\mathrm{OEP}}=\sum_{\mathrm{j}} \iint \frac{\delta \mathrm{E}_{\mathrm{xc}}}{\delta \varphi_{\mathrm{j}}} \frac{\delta \varphi_{\mathrm{j}}}{\delta \mathrm{v}_{\mathrm{s}}} \frac{\delta \mathrm{v}_{\mathrm{s}}}{\delta \rho}+\sum_{\mathrm{j}} \iint \frac{\delta \mathrm{E}_{\mathrm{xc}}}{\delta \varphi_{\mathrm{j}}} \frac{\delta \varphi_{\mathrm{j}}}{\delta \overrightarrow{\mathrm{~B}}_{\mathrm{s}}} \frac{\delta \overrightarrow{\mathrm{~B}}_{s}}{\delta \rho} \\
& \overrightarrow{\mathrm{~B}}_{\mathrm{xc}}^{\mathrm{OEP}}=\sum_{\mathrm{j}} \iint \frac{\delta \mathrm{E}_{\mathrm{xc}}}{\delta \varphi_{\mathrm{j}}} \frac{\delta \varphi_{\mathrm{j}}}{\delta \mathrm{v}_{\mathrm{s}}} \frac{\delta \mathrm{v}_{\mathrm{s}}}{\delta \overrightarrow{\mathrm{~m}}}+\sum_{\mathrm{j}} \iint \frac{\delta \mathrm{E}_{\mathrm{xc}}}{\delta \varphi_{\mathrm{j}}} \frac{\delta \varphi_{\mathrm{j}}}{\delta \overrightarrow{\mathrm{~B}}_{\mathrm{s}}} \frac{\delta \overrightarrow{\mathrm{~B}}_{\mathrm{s}}}{\delta \overrightarrow{\mathrm{~m}}}
\end{aligned}
$$

$\Rightarrow$ One has to deal with a $4 \times 4$ matrix of response functions

$\mathbf{m} \times \mathbf{B}_{\mathbf{x c}}$
is the spin torque appearing on the r.h.s of the equation of motion of the spin magnetisation. In the LSDA, this term vanishes, leading to an unrealistic spin dynamics. $\Rightarrow$ LSDA yields unrealistic spin dynamics.

Summary of noncollinear OEP:

- $\mathbf{m}(\mathrm{r})$ has stronger spacial variation in EXX than in LSDA
- $\mathbf{m}(\mathrm{r})$ locally not collinear with $\mathbf{B}_{\mathrm{xc}}$
- Improved spin dynamics: Importance for spintronics

Optimized Effective Potential Method for Non-Collinear Magnetism: S. Sharma, J.K. Dewhurst, C. Ambrosch-Draxl, S. Kurth, N. Helbig, S. Pittalis, S. Shallcross, L. Nordstroem E.K.U.G., Phys. Rev. Lett. 98, 196405 (2007)

## Functionals available in CDFT

CDFT-LDA: $\quad \mathrm{B} \longrightarrow$ vorticity $v(\mathrm{r}), \mathrm{n} \longrightarrow \rho(\mathrm{r})$
xc energy per particle of uniform gas in constant B field

$\mathrm{A}_{\mathrm{xc}}(\mathrm{r})$ has divergencies all over the place (Diplom thesis of Klaus Drese (1995))

## CDFT-OEP equations are easily formulated:

$$
\begin{aligned}
& \mathrm{v}_{\mathrm{xc}}^{\mathrm{OEP}}=\sum_{\mathrm{j}} \iint \frac{\delta \mathrm{E}_{\mathrm{xc}}}{\delta \varphi_{\mathrm{j}}} \frac{\delta \varphi_{\mathrm{j}}}{\delta \mathrm{v}_{\mathrm{s}}} \frac{\delta \mathrm{v}_{\mathrm{s}}}{\delta \rho}+\sum_{\mathrm{j}} \iint \frac{\delta \mathrm{E}_{\mathrm{xc}}}{\delta \varphi_{\mathrm{j}}} \frac{\delta \varphi_{\mathrm{j}}}{\delta \overrightarrow{\mathrm{~A}}_{\mathrm{s}}} \frac{\delta \overrightarrow{\mathrm{~A}}_{\mathrm{s}}}{\delta \rho} \\
& \overrightarrow{\mathrm{~A}}_{\mathrm{xc}}^{\mathrm{OEP}}=\sum_{\mathrm{j}} \iint \frac{\delta \mathrm{E}_{\mathrm{xc}}}{\delta \varphi_{\mathrm{j}}} \frac{\delta \varphi_{\mathrm{j}}}{\delta \mathrm{v}_{\mathrm{s}}} \frac{\delta \mathrm{v}_{\mathrm{s}}}{\delta \overrightarrow{\mathrm{~m}}}+\sum_{\mathrm{j}} \iint \frac{\delta \mathrm{E}_{\mathrm{xc}}}{\delta \varphi_{\mathrm{j}}} \frac{\delta \varphi_{\mathrm{j}}}{\delta \overrightarrow{\mathrm{~A}}_{s}} \frac{\delta \overrightarrow{\mathrm{~A}}_{\mathrm{s}}}{\delta \overrightarrow{\mathrm{j}}_{\mathrm{p}}}
\end{aligned}
$$

## When there is a strong external magnetic field, one has to use CSDFT.

```
When there is no magnetic field, one can use a given orbital
functional, e.g. EXX, within the framework of either
- DFT-OEP or
- SDFT-OEP or
- CSDFT-OEP
```

In each case, one minimizes the same total-energy functional $\mathrm{E}_{\mathrm{HF}}\left[\varphi_{1}, \varphi_{2}, \ldots \varphi_{\mathrm{N}}\right]$. But the minimization is performed over a different orbital sets $\left\{\varphi_{1}, \ldots \varphi_{N}\right\}$ :
DFT-OEP: $\varphi s$ come from a SE with a local potential $\mathrm{v}_{\mathrm{s}}(\mathrm{r})$ only.
SDFT-OEP: $\varphi s$ come from a SE with $v_{s}(r)$ and $B_{s}(r)$.
CSDFT-OEP: $\varphi s$ come from a SE with $v_{s}(r), B_{s}(r)$ and $A_{s}(r)$.

Obviously, $\quad \mathrm{E}_{\text {HF }} \leq \mathrm{E}_{\text {CSDFT-OEP }} \leq \mathrm{E}_{\text {SDFT-OEP }} \leq \mathrm{E}_{\text {DFT-OEP }}$ But these total energies are usually extremely close.

In systems without external magnetic field, does CSDFT-OEP give better results than SDFT-OEP for quantities other than the total energy (with EXX functional in both cases)?

Look at:

- Degeneracy of ground states of open-shell atoms
- Orbital magnetic moment of solids

Spurious energy splittings $\Delta=\mathbf{E}(\mathbf{M}= \pm 1)-\mathbf{E}(\mathbf{M}=0)$ (in kcal/mol) between current carrying and zero-current states computed in SDFT and CSDFT.

| Atom | $\Delta^{\text {SDFT }}$ | $\Delta^{\text {CSDFT }}$ |
| :---: | :---: | :---: |
| B | 1.66 | 1.38 |
| C | 1.58 | 1.34 |
| O | 2.36 | 2.29 |
| F | 2.32 | 2.27 |
| Al | 1.68 | 1.58 |
| Si | 1.76 | 1.63 |
| S | 3.04 | 3.01 |
| Cl | 3.15 | 3.10 |

S. Pittalis, S. Kurth, N. Helbig, E.K.U.G., Phys. Rev. A 74, 062511 (2006)

## Orbital magnetic moments in $\mu_{B}$

| Solid | Exp. | LSDA | GGA | EXX- <br> SDFT | EXX- <br> CSDFT |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Fe | 0.08 | 0.053 | 0.051 | 0.034 | 0.034 |
| Co | 0.14 | 0.069 | 0.073 | 0.013 | 0.013 |
| Ni | 0.05 | 0.038 | 0.037 | 0.029 | 0.029 |

S. Sharma, S. Pittalis, S. Kurth, S. Shallcross, J.K. Dewhurst, E.K.U. Gross, Phys. Rev. B (Rapid Comm.) (2007).

Summary
No significant improvement of the spurious energy splittings, and no improvement at all for magnetic moments, by minimizing total energy over the larger class of CSDFT orbitals rather than SDFT orbitals.

To improve magnetic moments and spurious splittings:
$\Rightarrow \Rightarrow$ Need orbital functionals for correlation!
